

RNN LIBRARY IN R

Asst.Prof.Dr.Supakit Nootyaskool
IT-KMITL

Topic

- RNN package
- Introduce RNN to Humidity Forecasting
- Changing data for training WeatherAUS dataset
- Understand 3D dimensions and setting RNN()
- Four inputs RNN
- Sum of Sine Waves

ลอง test กับ ๓๗, ๖๐ แล้วดูว่า

ตัวไหนมาใช้เลย

เพราะมันรู้ว่าจะทำอะไร

ออกมาค่าที่ได้จริงไหม!!

RNN PACKAGE

RNN package

Package features

- Native package in R (Development for R)
- <https://github.com/bquast/rnn>

Modisn

The screenshot shows the GitHub repository page for 'bquast/rnn'. The repository is in the 'master' branch, has 5 branches, and 7 tags. It was last committed by 'bquast' on July 4, 2020, with 202 commits. The file list includes: .github/workflows, R, inst, man, tests, vignettes, .Rbuildignore, .gitignore, DESCRIPTION, NAMESPACE, NEWS.md, README.md, cran-comments.md, and rnn.Rproj. A red arrow points to the README.md file. The README.md content shows the package name 'rnn', its license (GPLv3), CRAN version (1.4.0), R-CMD-check status (failing), coverage (30%), and downloads (47K). It also mentions 'Implementation of a Recurrent Neural Network in R.' and includes a 'Demonstration' section with a code snippet and a plot. The right sidebar shows the 'About' section with the description 'Recurrent Neural Networks in R', the link 'qua.st/rnn', and the 'Releases' section with 7 releases, the latest being 'Rum, Sodomy and t...' on Jul 4, 2020. The 'Packages' section shows 'No packages published'. The 'Contributors' section lists 'bquast Bastiaan Quast' and 'DimitriF'. The 'Environments' section shows 'github-pages' as 'Active'. The 'Languages' section shows 'R 100.0%'.

`trainr(Y, X, ...)`

คำสั่ง boxmim d

rnn

The variable X and Y are 3D array,

- dim 1 is samples
- dim 2 is time
- dim 3 is variables.

Y = target

X = input data

Install packages

```
install.packages("rnn")
```

```
install.packages("digest")
```

ติดตั้ง package แล้วไป

`rm(list = ls())`

Activity 8.1 Binary Addition

INTRODUCE RNN TO HUMIDITY FORECASTING

Humidity Forecasting

- To learn prediction data with RNN
 - Data from Australian weather stations.
 - Large data set by 145460 observations from 45 stations
 - The source dataset is copyrighted
 - A CSV version of this dataset is at <https://rattle.togaware.com/weatherAUS.csv> app. 21MB
- **Date**: The date of observation (a Date object).
 - **Location**: The common name of the location of the weather station.
 - **MinTemp**: The minimum temperature in degrees Celsius.
 - **MaxTemp**: The maximum temperature in degrees Celsius.
 - **Rainfall**: The amount of rainfall recorded for the day in mm.
 - **Evaporation**: The so-called class a pan evaporation (mm) in the 24 hours to 9 am.

- **Sunshine**: The number of hours of bright sunshine in the day.
- **WindGustDir**: The direction of the strongest wind gust in the 24 hours to midnight.
- **WindGustSpeed**: The speed (km/h) of the strongest wind gust in the 24 hours to midnight.
- **Temp9am**: Temperature (degrees C) at 9 a.m.
- **RelHumid9am**: Relative humidity (percent) at 9 a.m.
- **Cloud9am**: Fraction of the sky obscured by clouds at 9 a.m. This is measured in oktas, which are a unit of eighths. It records how many eighths of the sky are obscured by cloud. A zero measure indicates completely clear sky whilst an 8 indicates that it is completely overcast.

- **WindSpeed9am**: Wind speed (km/hr) averaged over 10 minutes prior to 9 a.m. 6 weatherAUS.
- **Pressure9am**: Atmospheric pressure (hpa) reduced to mean sea level at 9 a.m.
- **Temp3pm**: Temperature (degrees C) at 3 p.m.
- **RelHumid3pm**: Relative humidity (percent) at 3 p.m.
- **Cloud3pm**: Fraction of sky obscured by cloud (in oktas: eighths) at 3 p.m.
- **WindSpeed3pm**: Wind speed (km/hr) averaged over 10 minutes prior to 3 p.m.
- **Pressure3pm**: Atmospheric pressure (hpa) reduced to mean sea level at 3 p.m.

- **ChangeTemp**: Change in temperature.
 - **ChangeTempDir**: Direction of change in temperature.
 - **ChangeTempMag**: Magnitude of change in temperature.
 - **ChangeWindDirect**: Direction of wind change.
 - **MaxWindPeriod**: Period of maximum wind.
 - **RainToday**: Integer 1 if precipitation (mm) in the 24 hours to 9 a.m. exceeds 1 mm, and 0 otherwise.
 - **TempRange**: Difference between minimum and maximum temperatures (degrees C) in the 24 hours to 9 a.m.
 - **PressureChange**: Change in pressure.
- **RISK_MM**: The amount of rain. A kind of measure of the risk.
 - **RainTomorrow**: The target variable. Will it rain tomorrow?

Addition

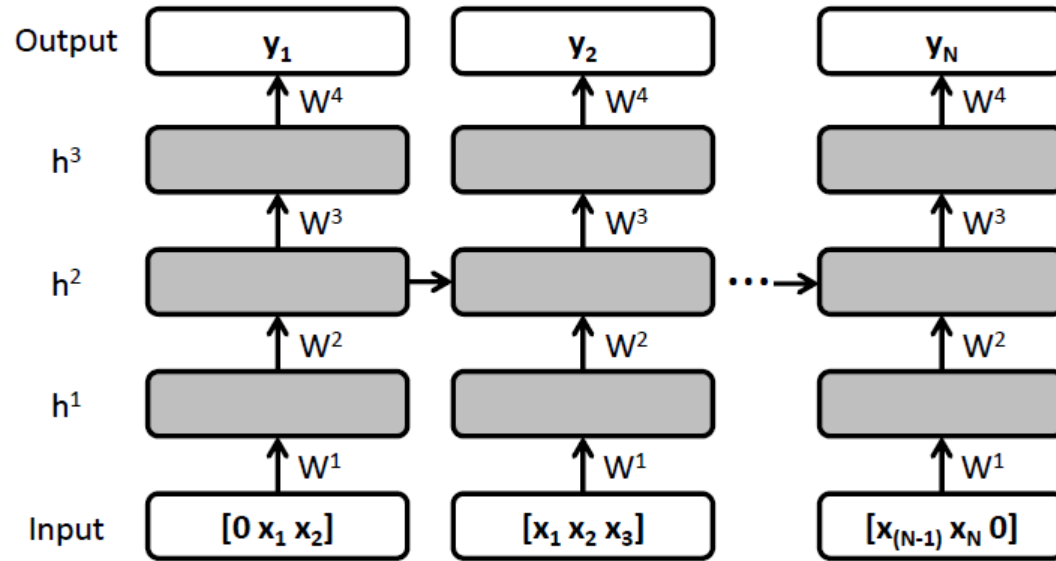

Figure 1: *Deep Recurrent Denoising Autoencoder. A model with 3 hidden layers that takes 3 frames of noisy input features and predicts a clean version of the center frame*

Fig. 2. Visualization of the amount of input information used for prediction by different network structures.

Fig. 3. General structure of the bidirectional recurrent neural network (BRNN) shown unfolded in time for three time steps.

Figure 4: Visualizing the network unfolded across time steps.

Figure 5: A recurrent neural network as proposed by Jordan (1986).

Figure 6: An Elman network as described in *Finding Structure in Time* (1990) [17]. Hidden units are connected 1-to-1 to context units across time steps, which in turn feed back into the corresponding hidden units.

Figure 7: A simple recurrent net with one input unit, one output unit, and one recurrent hidden unit.

Figure 8: A visualization of the vanishing gradient problem, using the architecture depicted in Figure 7. If the weight along the purple edge is less than one, the effect of the input at the first time step on the output at the final time step will rapidly diminish as a function of the size of the interval in between. An illustration like this appears in [23]
